	I. Introduction			

During the past few decades, drastic changes in the realm of business have shifted the focus of many organizations from tangible to intangible assets, one of the most prominent of which is knowledge. The intense global competition, rapid technological changes, and increased customer demands have forced many organizations to look for sustainable competitive advantages. Under such circumstances, mos firms try to distinguish themselves from other companies through knowledge (Ngai & Chan, 2005). To compete in business, firms have to make sure that knowledge is created, conveyed and shared inside their organizations, properly and the organization's environment plays an essential role for the advancement of this goal (Samimi & Aqayi, 2012). Many organizations such as Xerox and General

Abstract

Nowadays medical work is team work of several professionals (like for example in rehabilitation) so knowledge is a central issue in this field: the fast growing biomedical knowledge base is needed to be applied as fast and as effectively as possible to avoid medical errors. The suitable method for this purpose is a knowledge management system, which is based on the specialties of medical knowledge, and the expert teams of physicians and related professionals. The aim of this article is to review the literature on three levels: (1) personal level (medical knowledge and knowledge encapsulation theory by Boshuizen and Schmidt (1992) (2) team level (medical teamwork, e.g. in rehabilitation); (3) and organizational level (knowledge management systems).

The medical work has some specialties that constraint the possibilities of knowledge management. On one hand, medical development. knowledge in a high level of expertise is activated faster, but in a less detailed manner compared to other domains of knowledge; it is stored in an encapsulated form. On the other hand, as a consequence of medical work, any effective knowledge management system must be "baked in" the daily routine (Devenport, Glaser 2002). The user interface must be on the spot, avoiding additional efforts, and time needs. As a conclusion, this review is the integration of experiences and results from group interaction researches in high risk environment, and the practices from the knowledge management applications in several domains of work and to find the theoretical possibilities of a successful knowledge

The purpose of this study is to form a picture of knowledge, and knowledge management, focusing on the applied field of medicine and medical knowledge and teamwork to ameliorate the medical knowledge sharing, medical practice, and patient safety. At first the definition of knowledge and knowledge management is needed, then the review of the applicability of the knowledge management systems. Focusing on the medical field, the nature of medical knowledge and the development of medical expertise are of importance. From an extra-individual perspective the most important point is the necessity and advantages of medical teamwork and knowledge sharing. On the basis of these theoretical considerations, the study presents a functioning knowledge management system showing possibilities of applying such systems in Hungary, completed with teamwork

1 Knowledge

At the beginning of the general introduction of about the knowledge itself, it is important to review the cognitive psychological backgrounds based on the literature of the human memory. Knowledge as other long term memory contents is represented in different ways in the human mind. According to Tulving [18] there is an episodic and a semantic long term memory. This means the separation of a specific event and an experience related retrieval of memory contents (with context) form the general 'background knowledge', what is standing behind the
